

Unity 101

Final Project — Requirements

Overview

Build a simple 3D game that combines what you learned in this course. There are no complexity requirements — the important part is that you learn something by building it.

Deadline: October 18th, 11:59 PM

Submission method: Email (jiwon.kang@telecom-sudparis.eu) OR upload to Nextcloud

What You Must Deliver

- A Windows build of your project (the whole generated folder, not just the .exe file)
- A link to a PUBLIC Git repository with the latest version of your project
- A post-mortem of no more than 2 pages about one problem you encountered during development

About Your Project

- It must be a 3D game.
- There must be a button always accessible to quit the application entirely.
- You must have tested your project before handing it in.
- There are no complexity requirements. The important part is that you learn something developing it.

Required Technical Elements

- **Prefab** - at least one object in your game must be instantiated from a Prefab
- **Physics** - collisions between at least two objects
- **Boost** - ability that applies an instant force with `Rigidbody.AddForce()` on a key press.
- **UI** - an on-screen display (e.g. health or score) that updates in real time
- **Scene Transition** - — at minimum, a menu scene that loads into the game scene
- **Audio** - at least one sound effect or background music track.

Particle Systems and Animation are encouraged for polish but are optional, not required

About Your GitHub Repository

- It must use an appropriate .gitignore file for Unity projects.
- It must contain a Readme file (projects with Readmes are much more useful in your portfolio).
- Paid assets are allowed, but try to include on GitHub only the ones absolutely required for your project.

About Your Post-Mortem

- It must present the problem you encountered.
- It must explain the process you followed to narrow the problem down and fully understand it, including any hypotheses that turned out to be wrong.
- It must explain how you solved the problem.
